

1 PC Paging

PC Paging provides flexibility to allow any existing computer workstations to be utilized as a paging station.

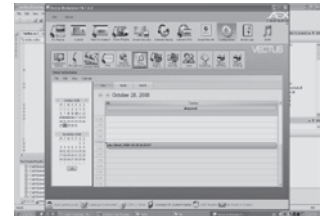

5 Visual Paging

Visual Paging allows building operators to visually monitor a situation while announcements are being made. This allows for more effective crowd control especially during emergency situations.

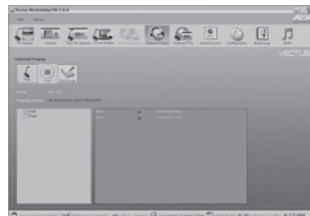

2 Text Streaming

Text Streaming provides consistent announcements by allowing audio paging to be done simply by typing the announcements into a paging terminal.

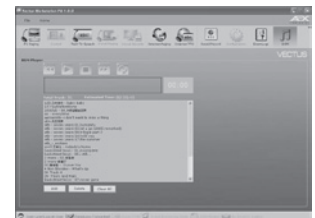

6 Time Scheduling

Time scheduling programs allows the system to perform automated daily tasks such as broadcasting of hourly messages such as opening times and closing times of a business operation. This allows business operations to run leaner and more efficiently.

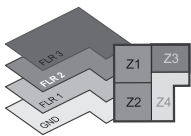

3 Internet Paging

Live paging can be simultaneously done up to four sites located outside the LAN. Three modes of broadcast are available; Direct Audio Streaming, Delayed Audio Streaming (with Time Scheduler) or Text Streaming when the bandwidth is limited.

7 Background Music Source

The VECTUS system also doubles up as a BGM source for MP3 playback.

4 Graphical Zone Selection

Allows operators to accurately select zones during announcements from a virtual building displayed.

8 Visual Security

Utilizing IP based CCTV, the system doubles up as a security personnel, automatically monitoring for intruders via motion-detection and preventing them from entering into the restricted area.
